Every start inside M* (A, B): measured = predicted
A: inside M*, positive
B: inside M*, random signs
A_bal: inside M*, balanced
prediction (equal times)
measured escape time of the full network
(first L < L_J - 0.001)
predicted escape time: isolated route, eq. 6.14-6.16
(gradient-flow time units)
The full network reproduces the reduced flow to ~1e-8
full network vs reduced flow on M*
full network vs isolated-route formula
P3 bound 1e-4
P4 bound 5 %
number of runs
relative difference of escape times |t_a / t_b - 1|
