MPS student
non-orthogonal CP
binary student
misaligned covariance
HT student
random TTN teacher
$N = 4$
$N = 8$
(a) saddle start, MPS students
escape time rescaled by the predicted slope
$\ln(1/\varepsilon)$
(b) saddle start, binary and HT students
$\varepsilon\, t_{\mathrm{esc}}$ relative to $\varepsilon = 10^{-3}$
noise at the saddle ε
(c) random init, $N = 4$: curvature at the plateau
$-\lambda_{\min}$ at the rank-one plateau
$\propto \sigma$
initialization scale σ
(d) random init, $N = 4$: second escape
second escape Δt_2
$\propto \sigma^{-1}$
initialization scale σ
