Plateau length ~ sigma^-exponent: the numerical route rule predicts the exponent on non-star targets;
the paper's route depth and the pairwise rule predict no plateau (0) where one exists (one point per target and plateau type)
Paper's route depth
Numerical route rule
Pairwise rule
measured = predicted
within 0.3
targets breaking the star condition
star-satisfying controls
fit incl. floor-flagged sigmas (secondary)
measured exponent of plateau length vs sigma
(median over seeds, bars = quartiles)
predicted 0 = log-time plateau
or no plateau at all
RND3_mps6
CTL1_mps6, RND1_mps6
predicted exponent: paper's route depth c*_J - 2
(applied outside its scope)
predicted exponent: numerical route rule k* - 2
(at the measured plateau point)
predicted exponent: pairwise rule: min Steiner cost - 2
