The escape from a plateau behaves like a route of depth k*, not of the paper's depth
effective depth = predicted
targets breaking the star condition
star-satisfying controls
effective depth of the escape
(slope of the loss growth law)
star-satisfying controls
one marker = one target and plateau type
(median over seeds, bars = quartiles)
star-satisfying controls
one marker = one target and plateau type
(median over seeds, bars = quartiles)
